EDITORIAL

New publisher, new opportunities

Paediatric and Perinatal Drug Therapy is pleased to inform readers that the journal will now be published by Informa Healthcare. This follows the sale of LibraPharm to Informa. The vast majority of the staff who worked for LibraPharm and helped produce Paediatric and Perinatal Drug Therapy will be staying with the new company. This gives us the unique situation whereby we continue to produce the journal with the same individuals but now have access to a much larger audience through publicity within other publications by Informa Healthcare.

Informa Healthcare incorporates Taylor and Francis and has a broad spectrum of medical journals including several which focus in the area of pharmacology. Informa Healthcare sees Paediatric and Perinatal Drug Therapy as a journal with a considerable future ahead. It is the leading journal in this field with an editorial board of international repute. The quality of the articles remains at a high standard and there are an increasing number of original articles, interestingly both from academia and the pharmaceutical industry.

With the establishment of Paediatric and Perinatal Drug Therapy as a quarterly journal alongside highly successful developments such as the introduction of FastTrack publication, we are at an exciting stage in the journal's development¹.

From the reader's point of view, there are unlikely to be any obvious changes. The aim

is to retain the same style and ensure that the quality of the published articles remains at a high standard. The current facility for readers to access FastTrack publications² will remain the same, i.e. they can be accessed on the following website (www.librapharm.com) by going to Table of Contents for Paediatric and Perinatal Drug Therapy. This facility will remain the same for the immediate future and we hope to make further improvements. Paediatric and Perinatal Drug Therapy will hopefully continue to play an important role in ensuring that medicines are used more safely and effectively in children of all ages throughout the world.
